

Graphing in standard form.

What is the equation for vertex form:

$$y = a(x-h)^2 + k$$

Equation for standard form:

$$y = ax^2 + bx + c$$

Let's multiply through to get into standard form.

1) $f(x) = 4(x-2)^2 - 3$

$$4(x-2)(x-2) - 3$$

$$(4x-8)(x-2) - 3$$

	$4x$	-8
x	$4x^2$	$-8x$
-2	$-8x$	16

$$4x^2 - 16x + 16 - 3$$

$$y = 4x^2 - 16x + 13$$

2) $f(x) = -(x+3)^2 + 2$

$$-(x+3)(x+3) + 2$$

$$(-x-3)(x+3) + 2$$

	$-x$	-3
x	$-x^2$	$-3x$
3	$-3x$	-9

$$-x^2 - 6x - 9 + 2$$

$$y = -x^2 - 6x - 7$$

3) $f(x) = \frac{1}{2}(x+1)^2$

$$\frac{1}{2}(x+1)(x+1)$$

$$(\frac{1}{2}x + \frac{1}{2})(x+1)$$

	$\frac{1}{2}x$	$\frac{1}{2}$
x	$\frac{1}{2}x^2$	$\frac{1}{2}x$
1	$\frac{1}{2}x$	$\frac{1}{2}$

$$y = \frac{1}{2}x^2 + x + \frac{1}{2}$$

Now let's look at a problem in vertex form and standard form.

$$f(x) = (x-1)^2 - 3$$

What form:

Vertex form Right 1
Down 3

List out all the information needed to graph.

$$(x-1)^2 - 3$$

Vertex $(1, -3)$

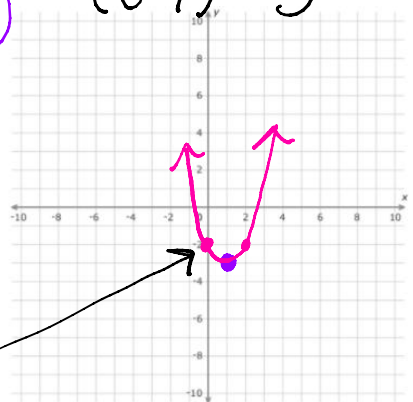

$$(0-1)^2 - 3$$

$$(x-1)(x-1) - 3$$

	x	-1
x	x^2	$-x$
-1	$-x$	1

$$x^2 - 2x + 1 - 3$$

X	Y
0	-2
1	-3
2	-2

$$x^2 - 2x - 2$$

Let's look at this problem.

$$f(x) = x^2 - 2x - 2$$

Can you easily find the vertex here?

NO

Let's list out the a, b and c for the equation above.

Standard

a: 1 b: -2 c: -2

We need to use

$$x = -\frac{b}{2a}$$

Let's find the x - value of the vertex 1st. (H)

Then substitute x into the equation to find the y - value. (K)

$$\frac{-b}{2a} = \frac{-(-2)}{2(1)} = 1$$

$$(1)^2 - 2(1) - 2 = -3$$

Find a.

Now let's create the vertex form equation:

$$y = a(x - h)^2 + k$$

$$y = 1(x - 1)^2 - 3 \quad \text{Vertex } (1, -3)$$

How does this equation compare to the previous problem? Same? Different?

A stays same

Std. form \rightarrow y-int
Vertex form \rightarrow Vertex

Let's try some more. We are going to convert from STANDARD FORM to VERTEX FORM (so we can GRAPH).

1) $y = -4x^2 - 8x + 7$

$a = -4$ $b = -8$ $c = 7$

$$\frac{-(-8)}{2(-4)} = -1 \quad -4(-1)^2 - 8(-1) + 7 = 11$$

$$y = -4(x + 1)^2 + 11$$

Reflect v. stretch

Vertex (-1, 11)

X	Y
-2	7
-1	11
0	7

$$-4(0+1)^2 + 11$$

2) $y = \frac{1}{2}x^2 + 10x - 1$

$a = \frac{1}{2}$ $b = 10$ $c = -1$

$$\frac{-10}{2(\frac{1}{2})} = -10$$

$$\frac{1}{2}(-10)^2 + 10(-10) - 1 = -51$$

$$y = \frac{1}{2}(x + 10)^2 - 51$$

H. stretch left 10

Down 51

Vertex (-10, -51)

3) $y = x^2 + 6$

$a = 1$ $b = 0$ $c = 6$

$$\frac{-(0)}{2(1)} = 0$$

$$(0)^2 + 6 = 6$$

$$y = 1(x - 0)^2 + 6$$

$$y = x^2 + 6$$

UP 6

Vertex (0, 6)

2) $y = -x^2 - 2x$

$a = -1$ $b = -2$ $c = 0$

$\frac{-(-2)}{2(-1)} = -1$ $\frac{-(-1)^2 - 2(-1)}{2(-1)}$

$y = -1(x+1)^2 + 1$

reflect

Vertex

	$(-1, 1)$
X	Y
-2	0
-1	1
0	0

$-1(0+1)^2 + 1$

~~$f(x) = 3x^2 - 6x + 8$~~

6) $f(x) = 2x^2 + 3x - 5$

$a = 2$ $b = 3$ $c = -5$

$\frac{-3}{2(2)} = -\frac{3}{4}$ OR -0.75

$2(-0.75)^2 + 3(-0.75) - 5$
 -6.125 OR $-\frac{49}{8}$ k

$y = 2(x + \frac{3}{4})^2 - \frac{49}{8}$

BIG PROBLEM!

$y = (x - 2)(x - 4)$

Intercept

Let's list out the information we know.

x-ints:

$x - 2 = 0$ $x - 4 = 0$

$(2, 0)$ $(4, 0)$

standard form:

	X	-2
X	x^2	$-2x$
	$-4 + 4x$	8

$y = x^2 - 6x + 8$

y-int:

$(0, 8)$

Convert to vertex form from standard form above.

$y = x^2 - 6x + 8$ $a = 1$ $b = -6$ $c = 8$

$\frac{-(-6)}{2(1)} = 3$ $(3)^2 - 6(3) + 8 = -1$ k

List all the shifts that occur. Now graph it!

$y = 1(x - 3)^2 - 1$
 Right 3
 Down 1

$$y = 2(x-1)(x+9)$$

Int \rightarrow Std \rightarrow Vkt
